

Stopgun

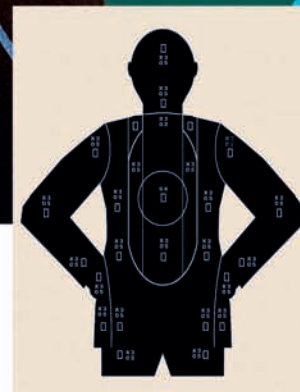

Excessive exposure to impulse sound such as during shooting training (professional or amateur) can cause irreversible hearing damage. Suitable hearing protectors can avoid this damage.

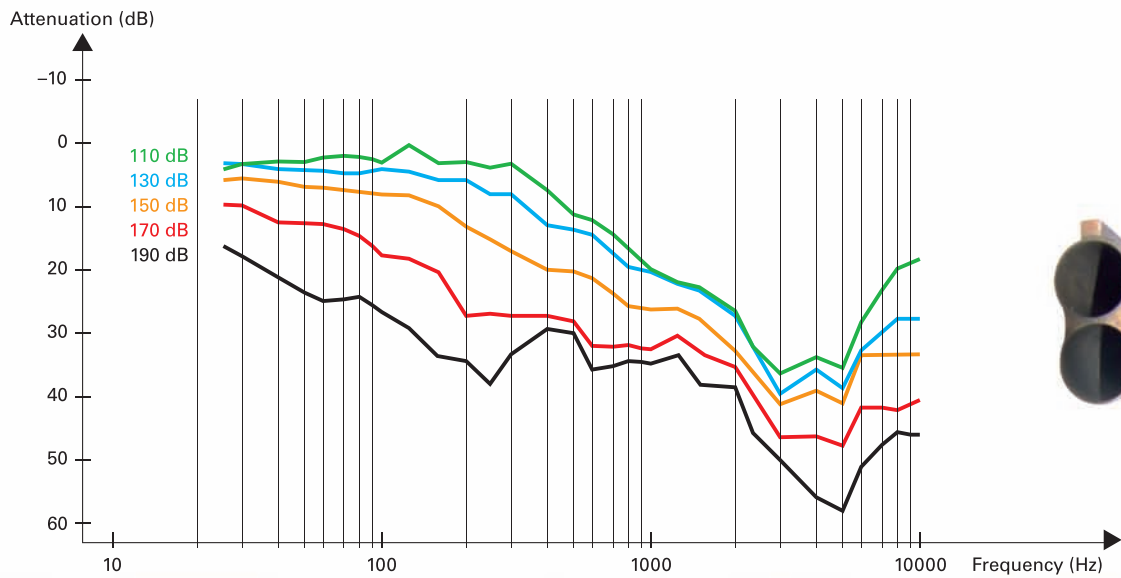

Due to the special construction of the passive impulse noise filter, the Stopgun guarantees an optimal protection against peak sound, whilst allowing hearing of spoken communication and environment sound. This custom made hearing protector, manufactured from silicon material, has a non-linear filter that has been especially designed for impulse sound. This hearing protector mainly restrains the impulse sound and allows the continuous sound waves and environment sound through clearly because of the specific action of the passive filter.

In one aspect the success of the Stopgun is due to the perfect fit that provides a high wearing comfort. The Stopgun also offers optimal protection against impulse sound which is a danger to the ear in order that the risk of hearing damage is minimized.

The Stopgun is user-friendly and available in several colours. The hearing protector as standard is delivered in a rigid storage pouch with an earwax removing tool and cleaning tissue.

Features

- ultra-fast function time
- passive compression
- integrated impulse sound filter
- soft, flexible material

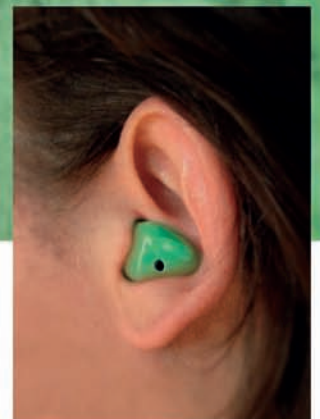

Application

- shooting
- military

Specifications

- Weight:** 4 grammes
- Material:** 50 till 70 shore silicon material
- Colour:** several colours available
- Accessories:** storage pouch with cleaning set

Specifications of this product may be subject to design improvements without notice. Specification as at 01.09.2005
